KNN-implementation

Using simple iris dataset, I implemented KNN model without using sklearn.
Here I used 3-Nearest Neighbours.

About KNN :

```
- Calculate the distance of query point from all the training points and consider requred Neares neig
hbours i.e.
   the closest  points (here 3 closest points)
- Class label is predicted using majority class vote of considered nearest neighbours.
- KNN does not have training phase. Training data is used to provide nearest neighbours.
- KNN is called as lazy algorithm since it has no learning phase
```

In [6]:
```
from sklearn import datasets
import numpy as np
from collections import Counter
from sklearn.model_selection import train_test_split
```

In [7]:
```
data = datasets.load_iris()
```

In [8]:
```
data.target
```

Out[8]:
```
array([0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0,
       0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0,
       0, 0, 0, 0, 0, 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1,
       1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1,
